                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          http://www.sanger.ac.uk/Projects/C_elegans/wormpep IMPORTANT: This sequence is not the entire insert of clone XY-PXYR7CC1 It may be shorter because we only sequence overlapping sections once, or longer because we arrange for a small overlap between neighbouring
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The following abbreviations are used to associate primary accession numbers given in the feature table with their source databases: Em:, EMBL; Sw:, SWISSPOT; Tr:, TREMBL; Wp:, WORMPEP; Information on the WORMPEP database can be found at
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             together with a note of the overlapping clone name. Note that the variation annotation may not be found in the sequence submission corresponding to the overlapping clone, as we submit sequences with only a small overlap as described above.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              During sequence assembly data is compared from overlapping clumhere differences are found these are annotated as variations
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       human chromosome 22, constructed by the Sanger Centre Chromosome Mapping Group. It currently consists of 25 contigs. The true order of the pieces is not known and their order in this sequence record is arbitrary. Gaps between the contigs are represented as runs of N, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence as soon as it is available and the accession number will be preserved.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Local Similarity
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             2 tggattgtcagctctccatcctccttctcagctgctctgttctcgacagcttcgggg 61
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   requests: clonerequest@sanger.ac.uk
on Nov 29, 1999 this sequence version replaced gi:@468554
During sequence assembly data is compared from overlapping clones.
Where differences are found these are annotated as variations
together with a note of the overlapping clone name. Note that the
variation annotation may not be found in the sequence submission
corresponding to the overlapping clone, as we submit sequences with
only a small overlap as described above.
This sequence has been finished according to sequence map criteria
as follows. An attempt is made to resolve all sequencing problems,
such as compressions and repeats, but not necessarily within known
annotated human repeat sequence elements (e.g. Alu). Where the
sequence is ambiguous, there is an annotation using the 'unsure'
feature key.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         GGCTGAATCC
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            44;
                                                                                                                                                                                                            The following abbreviations are used to associate primary accession numbers given in the feature table with their source databases:
Em:, EMBL; Sw:, SWISSPROT; Tr:, TREMBL; Wp:, WORMPEP; Information on the WORMPEP database can be found at http://www.sanger.ac.uk/Projects/C_elegans/wormpep This sequence was generated from part of bacterial clone contigs of human chromosome 6, constructed by the Sanger Centre Chromosome 6 Mapping Group. Further information can be found at http://www.sanger.ac.uk/HGP/Chr6
RP1-72EL7 is from the library RPCI-1 constructed at the Roswell Park Cancer Institute by the group of Pleter de Jong. For further details see http://bacpac.med.buffalo.edu/

It currently consists of 44 contigs. The true order of the pieces is not known and their order in this sequence record is arbitrary. Gaps between the contigs are represented as runs of N, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence as soon as it is available and the accession number will be preserved.

On Feb 16, 2000 this sequence version replaced 91:6912160.

MPORTANT: This sequence is unfinished and does not necessarily
represent the correct sequence. Work on the sequence is in
progress and the release of this data is based on the understanding
that the sequence may change as work continues. The sequence may
be contaminated with foreign sequence from E.coli, yeast, vector,
phage etc. Order of segments is not known; 800 n's separate
segments: Contig.ID: 00006 Length: 9572bp

It currently consists of 59 contigs. The true order of the pieces is not known and their order in this sequence record is arbitrary. Gaps between the contigs are represented as runs of N, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence as soon as it is available and the accession number will be preserved.

Match
      is the number of results predicted by chance to have a ster than or equal to the score of the result being printed, rived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   US-09-104-340-7

Probes derived from the EPH-related PTKs Cek4 (Q90659) and Cek5 (Q90660) were used to isolate novel cDNA clones (Q90652-58, Q90661-62) from chicken embryo and embryonic brain libraries.

Cek4 is highly expressed in the chicken developing brain and embryonic tissues, as well as in the adult brain and retina.

reconstitution and therapeutically to modulate receptor activation or prodn.

recons. (702946-49) coding for 4 novel human EPH-like receptor protein consecutively, coding kinases, HEK5, HEK7, HEK8 and HEK11 (R85089-92), respectively, cover isolated from a human foetal brain CDNA library using a directed CC PCR approach with primers (see T02960-61) based on conserved regions of creceptor PTKs and EPH-like receptor PTKs. HEK5, HEK7 and HEK8 show CC extensive homology to the catalytic domain of chicken EPH-like receptors. The isolated cDNAs are used for prodn. of creceptors CeK5, Cek7 and Cek8. HEK11 shows no homology to any known CC recombinant HEKS and chimeric receptors, in hybridisation assays, and CC to detect abnormalities in HEK receptor genes.

                                           INA encoding embryonic stem cell kinase, receptor tyrosine kinase -

"for production of modulators and antibodies, useful to treat

"mucositis and other disorders involving epithelium

"Claim 4; Page 48-54; 98pp; English.

"A isolated nucleic acid molecule (172320) codes for novel mouse

embryonic stem cell kinase (Esk), a receptor tyrosine kinase that

"C belongs to the Eph subfamily. To isolate the molecule, RNA from

"C using primers (see also T72321-24) based on conserved Eph

"Sequences. A labelled probe from an isolated clone was used to

screen a mouse liver cDNA library, identifying a single clone that

Included the complete coding region of Esk. The gene for murine

Esk is located on bands B1 and B2 of chromosome 6. Esk nucleic

acids can be used to produce recombinant Esk polypeptides, develop

probes, and as sense and antisense molecules for diagnosis or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Query Match

Claim 1; Page 66-71; 133pp; English.

CONAS (T02946-49) coding for 4 novel human EPH-like receptor protein tyrosine kinases, HEK5, HEK7, HEK8 and HEK11 (R85089-92), respectively, were isolated from a human foetal brain cDNA library using a directed PCR approach with primers (see T02960-61) based on conserved regions of receptor PTKs and EPH-like receptor PTKs. HEK5, HEK7 and HEK8 show extensive homology to the catalytic domain of chicken EPH-like receptors Cek5, Cek7 and Cek8. HEK11 shows no homology to any known EPH-like receptor. The isolated cDNAs are used for prodn. of recombinant HEKS and chimeric receptors, in hybridisation assays, and

Claim 5; Fig 22; 194pp; English.
Claim 5; Fig 22; 194pp; English.
The present invention describes nucleic acid molecules for ror-1, enk-1 and ehk-2. Also described are the corresponding prot Ror-1; Ror-2; Ehk-1; and Ehk-2. The proteins are orphan receptor tyrosine kinases. The present sequence encodes rat Ehk-1; tyrosine kinases. The present sequence encodes rat Ehk-1; 1097 A; 876 C; 990 G; 943 T;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                US5843749-A.

Example 1; Page 47-49; 75pp; English.

A CDNA clone (T18893) codes for rat REK7 (R97853), an eph-related tyrosine kinase receptor, for which AL-1 (see also w97854) is a tyrosine kinase receptor, for which AL-1 (see captor tyrosine kinase ligand. It was isolated using degenerate receptor tyrosine kinase primers (T18894-96) to amplify cDNAs of an adult mouse hippocampal CDNA library. A PCR fragment was used as a probe to isolate the full-length REK7 cDNA from a rat hippocampal CDNA library. An extraction of the companion of the c
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     signal_peptide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Key

Example 1; Page 115-116; 128pp; English.

EDNA cloning using adult mouse brains and MDK1 T2 (T32962), that coded for truncated versions (W03422 and W03423, respectively) of the novel mouse developmental kinase 1 (MDK1) (see also T32960), a new member of the eck/eph family of receptor tyrosine kinases.

MDK T1 and T2 each possess the entire ectodomain, the transmembrane domain and part of the juxtamembrane region of MDK1 (see also W03421), but lack the catalytic tyrosine kinase domain. They may have a modulatory function. The cDNA clones can be used to produce MDK1 T1 and T2, which are useful for screening potential agents for treatment of diseases characterised by abnormal signal transduction. Example 1; Page 111-12; 128pp; English.

CDNA cloning using adult mouse brains and MDK1 T2 (T32962), that identified 2 clones, MDK1 T1 (T32961) and MDK1 T2 (T32962), that coded for truncated versions (M03422 and M03423; respectively) of the novel mouse developmental kinase 1 (MDK1) (see also T32960), a new member of the eck/eph family of receptor tyrosine kinases.

MDK T1 and T2 each possess the entire ectodomain, the transmembrane domain and part of the juxtamembrane region of MDK1 (see also W03421), but lack the catalytic tyrosine kinase domain. They may have a modulatory function. The cDNA clones can be used to produce MDK1

T1 and T2, which are useful for screening potential agents for treatment of diseases characterised by abnormal signal transduction. Sequence 2901 BP; 890 A; 578 C; 650 G; 783 T;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Mouse developmental kinase 1 MDK1 T1 clone.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Example 1; Page 103-105; 128pp; English.

A cDNA clone (T32960) codes for mouse developmental kinase 1 (MDK1)

( W03421), a new member of the eck/eph family of receptor tyrosine

kinases (RTKs). To isolate the clone, cDNA from mouse embryos was

subjected to PCR amplification with primers based on conserved

motifs (see also W03426-27) of RTKs. An amplified fragment was used

to screen an 11.5-day-old mouse embryo and an adult mouse brain cDNA

library to obtain the MDK1 clone. 4 Sequence variants (see also

T32961-62 and W03422-25) of MDK1 were also identified. MDK1 nucleic

acids can be used for the recombinant prodn. of MDK1, as probes to

detect MDK1, and for the gene therapy of diseases involving

abnormalities in signal transduction, such as neurodegenerative and

neuroproliferative disorders and cancer.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The present sequence encodes mouse Bsk, which is a receptor-like tyrosine kinase. The nucleic acid sequence encoding Bsk can be used in Bsk nucleic acid probes, which can be used in detecting alterations in the level of Bsk messenger-RNA (mRNA) in biological samples isolated from a mammal afflicted with a disease, such as neurodegenerative diseases or disorders and neoplasms. The nucleic acid sequence can also be delivered into the limbic system of patients with limbic system neurodegenerative disease, disorder or injury, to promote or enhance limbic system neuron regeneration or growth. Such neurodegenerative disease include, chromosomal abnormalities, degenerative growth and development disorders, viral infections, bacterial infections, brain schizophrenia, or stroke and cerebral ischaemia.

           Claim 2; Page 8-11; 18pp; English.

Two cDNA libraries were prepared, one from murine osteoblast-like cell line MC3T3-E1 and the other from mouse hepatic tissues. Doubl stranded fragments of 300 bp were obtained using a random extensic primer and were blunt-ended. The ds linker ATOS-1/2 was ligated to the MC3T3-E1 cDNA and the ds linker ATOS-4/5 was ligated to liver

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  (Q71304) or ATOS-4 (Q71305), respectively. DNA specific for MC3TT-E1 was obtained by subtraction of sequences also found in liver library, then amplification with ATOS-1. This was a first step in the cloning procedure for isolating a MC3T3-E1 specific clone, coding for OSF-6 (see Q71303).
